CCAC publishes guidelines on marine mammal care

Established in 1968, the Canadian Council of Animal Care (CCAC) is a not-for-profit, national agency responsible for setting and maintaining standards for the ethical use and care of animals in science (research, teaching, and testing) throughout Canada. Twenty-four scientific and animal welfare member bodies make up the CCAC and together they seek to advance the welfare of animals used in science through four key areas: a Standards Program; an Assessment and Certification Program; Public Affairs and Communication; and Operations.

Under the Standards Program, CCAC develops and revises guidelines according to: current and emerging needs of the research community; advances in laboratory animal care; and the needs of the CCAC Assessment and Certification Program. Guidelines are produced by a sub-committee of experts, selected according to their knowledge in one or more areas to be covered by the guidelines, and are based on scientific evidence and expert opinion. Guidelines also undergo extensive peer review.

The latest guidelines produced by the CCAC cover the care and use of marine mammals and are intended for all Canadian institutions that house these animals. The recent guidelines replace a previous CCAC document which covered marine mammal care (*Chapter XVII — Marine Mammals, Guide to the Care and Use of Experimental Animals, Volume 2*, published in 1984).

Marine mammals are defined as all members of the Order Cetacea (whales, dolphins and porpoises), the Order Sirenia (manatees and dugong), and within the Order Carnivora, the Family Phocidae (true seals), the Family Otariidae (eared seals and sea lions), the Family Odobendidae (walrus), and the sea otter (*Enhydra lutris*).

The bulk of the guidelines focus on providing information within the following chapters: General Considerations; Facilities; Facility Management, Operation and Maintenance; Acquisition and Disposition; Transportation; Husbandry; and Animal Health Care. Each chapter is divided into subsections

and, where applicable, a specific guideline is given. Guidelines may be mandatory (in which case the term ‘must’ is used), or a guideline may indicate an obligation (in which case ‘should’ is used, and any exceptions must be justified and approved by an ACC). Sixty-four specific guidelines are presented in total.

For example, within the chapter considering Husbandry there are 11 subsections and information and guidelines are presented on: Quality of Life; Daily Care and Maintenance; Record Keeping and Documentation; Standard Operating Procedures; Housing; Nutrition and Feeding Practices; Handling and Restraint; Animal Training; Quarantine and Isolation; Behavioural or Management Separation; and Breeding Management. Within section 7.1, Quality of Life, Guideline 43 states that: “Institutions housing marine mammals must give careful attention to the quality of life of the animals and address their social and behavioural requirements throughout the duration that they are held, as the interests and activities of the animals may change with age”.

The CCAC emphasise that in order to successfully cater for the many needs of captive marine mammals, an interdisciplinary approach must be used, involving the Animal Care Committee (ACC), management, animal care personnel, veterinary personnel, and investigators.

It is hoped that the guidelines will improve the care of marine mammals and the way in which experimental procedures are carried out.

Other guidelines currently under development by the CCAC include: genetically engineered animals; care and maintenance of rats; care and maintenance of mice; and care and maintenance of non-human primates.

CCAC Guidelines on the Care and Use of Marine Animals (December 2014). A4, 73 pages. Canadian Council on Animal Care. Print ISBN 978 0 919087 55 2. Available at: http://www.ccac.ca/Documents/Standards/Guidelines/CCAC_Marine_Mammals_Guidelines.pdf.

Californian legislation to prevent the confinement of veal calves, egg-laying hens and pregnant pigs now in effect

In November 2008, Californian voters passed, by a margin of 63 to 37%, an initiative measure called Proposition 2. Proposition 2 sought to improve the welfare of farmed animals by preventing the cruel confinement of calves raised for veal, egg-laying hens and pregnant pigs, and resulted in a number of new provisions being added to the Californian Health and Safety Code, Chapter 13.8, Farm Animal Cruelty.

The new legislation, cited as the Prevention of Farm Animal Cruelty Act, states that: “a person shall not tether or confine any covered animal, on a farm, for all or the majority of any day, in a manner that prevents such animal from: a) lying down, standing up, and fully extending his or her limbs; and b) turning around freely”. The Act includes a division on definitions which explains the meaning of a number of terms. For example, “fully extending his or her limbs’
