INTRODUCTION: A 23 year old woman with an established diagnosis of eating disorder was analysed for multiple personality traits in the background of a multifactorial etiology.

OBJECTIVES: 1) Establishing secondary complications in the case
2) Diagrammatically representing the findings

AIM: 1) Identifying the personality traits
2) Etiological analysis

METHODS: 1) Retrospective analysis of all medical and psychiatric events.
2) Interviewing the patient and relatives.
3) Research
4) Analysis of all medical investigations carried out.
5) Response to multidisciplinary management.

RESULTS:

CONCLUSION: It was confirmed that multiple factors played their roles in the development of the condition including both familial and environmental agents.
