including curative measures) to prevent suicide 'in any case where he does not have reason to believe that the determination on self-destruction is fixed and unalterable'—and ECT could be regarded as a means of determining how fixed and unalterable was the intention. Even Jacob,[3] citing Skegg, allows doctors 'to impose treatment to alleviate the immediate condition . . . of the suicidally depressed'. In general, Jacob permits nursing care of the detained; but such care cannot usually be afforded to the detained without such concomitant medically imposed treatments as sedative drugs—and if drugs why not ECT? It is arguably no more drastic. While, then, it would always be reasonable to discuss both with detained patients and their relatives, whenever possible, the reasons underlying the need for ECT, the authoritative position of the RMO in deciding should never be dissimulated.

As to (4) above, the Percy Commission[4] made its intention clear that 'the law should no longer prevent mentally ill patients from entering hospital without being subject to detention if they cannot make a valid positive application for admission' (para 22). Expanding, it claimed that 'most non-volitional patients of the type who are now admitted as temporary patients' (under the Mental Treatment Act, 1930) 'could be treated without powers of detention' (para 290). As the result of their proposal (para 291) for '. . . the offer of care, without deprivation of liberty, to all who need it and are *not unwilling* to receive it' (my italics), the Mental Health Act repealed the Mental Treatment Act and its provision for temporary treatment; and the above-cited Memorandum[1] (para 16) stated that 'arrangements for the informal admission . . . of patients who are *not unwilling* to be admitted . . . are already in operation' (my italics). The College's proposal, then, to detain under Section 26 all such patients needing ECT is patently retrograde. Surely it can suffice that the case file should have inserted the written statement of the consultant in charge (preferably after discussion with the nearest relative) that (a) the patient needs ECT to preserve his/her life and health and (b) he/she is incapable by reason of the illness of either giving or withholding consent?

I can but hope that most psychiatrists will not feel constrained by the College's advice to take mad measures simply to safeguard themselves (if the measures recommended do safeguard) in the administration of ECT.

DEAR SIR,

Although the Memorandum on the Use of ECT, (*Journal*, September 1977, pp 261–72) is one of the most objective and scientific reports on this controversial subject, I find it very difficult to accept its suggestion, under the subtitle: Who decides that a patient needs ECT?, that this decision has to be taken by the consultant responsible for the patient in discussion with his junior staff and *the nursing and paramedical staff*. I do not think that an occupational therapist, a staff nurse or a social worker has the qualification or the experience to have any say in this decision, exactly as they have no say in whether the consultant will prescribe imipramine or amitriptyline to his depressed patient. It is a purely clinical and medical decision, and if we make it a democratic one the medical staff's opinion will be overpowered by the paramedical staff, who for obvious reasons usually oppose this type of treatment, and who in any clinical meeting outnumber the medical staff.

I also wonder how the report can think that a psychiatrist of registrar grade is too junior to decide on the need for ECT (p 268) and at the same time recommend that the consultant's decision on the need for ECT must have the blessing of the nursing and paramedical staff. It is the same story time and again, whenever the psychiatrists step into an uncertain territory they seek the support of other professions by inviting them to share their purely medical decisions, hoping that by doing this they will take part of the blame if things for any reason go wrong.

DEAR SIR,

It is disconcerting to see the subjective way in which the College's Special Committee on the use of ECT has approached its task of evaluating the evidence from clinical trials.
