# Introducing the benefits of catheter-related

## ARROWgard™\*. The first and only central venous

Complications due to catheter-related bacteremia are medically unacceptable when the causes are preventable. And in today's health-care climate, the monetary cost of treating nosocomial infection versus the cost of prevention is similarly unacceptable.

Fortunately, the forces of prevention have gained a new weapon,

ARROWgard™ is a patented colo-

nization-resistant chlorhexidine and silver sulfadiazine antiseptic surface molecularly bonded into the polyurethane catheter material along the entire indwelling length of each ARROWgard™ blue line CVC.

A recent study indicates that catheters with ARROWgard™ protection were twofold less likely to be colonized than control catheters and fourfold less likely to produce bacteremia. The study also noted a considerable lengthening of the safe indwelling period for ARROWgard™ catheters compared to control catheters.<sup>1</sup>

ARROWgard™ infection protection is presently available in select multi-lumen\*\* and single-lumen CVC kits. It will soon be available on other Arrow critical-care products.

**The benefits of CVCs are not without risk**

There is no question that central venous catheterization (CVC) represents

a significant medical advancement, particularly in treatment of the critically ill. However, with increased usage there is an increased risk of CVC-related infection.

The reported frequency of intravascular device-associated bacteremia is between 0.2% and 0.5% for IV peripheral catheters, up to 7.0% for central parenteral nutrition catheters—and from 3.8% to 12.0% for central venous catheters.<sup>2</sup> In short, 80% to 90% of each year's cases of intravascular-related bloodstream infection arise from the use of CVCs.<sup>3</sup> Moreover, a 10% to 20% case fatality rate has been

associated with catheter-related bacteremia?

In an address to

the Third International Conference on Nosocomial Infections, Dr. Dennis Maki stated that one-third of nosocomial infections are preventable, especially the 50,000 cases a year that develop from CVCs. Some 80% of these catheter-related infections arise from bacteria found on the skin that migrate down the catheter track, Dr. Maki noted.

Awareness is, of course, part of the battle. But more ammunition is needed. And that's why we developed ARROWgard™.

**More infection control means more financial control**

In a study published in 1988

reporting 1986 results, Hampton and Sheretz determined that nosocomial infection added a mean of seven days to a normal hospital stay and **increased the cost by a mean of more than \$6,000!**<sup>5</sup>

An additional downside: Medicare reimburses very little of the cost if a hospital stay is extended to treat bacteremia.

When you add the increases in cost since these studies were made, the economic impact of CVC-related infection is even more severe. And while new drugs to fight septic infections offer hope of better management in some crisis cases, the extreme costs pose a clinical dilemma for caregivers.

But ARROWgard™ can help reverse those spiraling figures.

Let's say that a hospital places 500 multi-lumen CVCs a year. If the infection rate is 4%, 20 infections result. By

\*4% Infection Rate and \$6,000 Mean Cost.<sup>3, 5</sup>

Clinical and Publication References: <sup>1</sup>Maki, DG, Wheeler, SJ, Seitz, SM, Nemec, LA: Clinical trial of a novel antiseptic-coated central venous catheter. Abstract of paper presented at 3rd ICAAC Clinical Infections, October 1, 1991. <sup>2</sup>Ellis, TS: Intravascular device infections. J. Med. Microbiol.; 27:181-187, 1988. <sup>3</sup>Cocrois, ML, et al: Infections related to central venous catheters. Mayo Proc.; 65:374-380, 1986. <sup>4</sup>Maki, DG: Nosocomial Infections. Address at the Conf. on Nosocomial Infections, Atlanta, July, 1988. <sup>5</sup>Hampton, AD, Sheretz, RJ: Yearly nosocomial infections in hospitalized patients. Surg. Clin. North Am.; 65:57-71, February, 1990.

# ginning of the end ed bacteremia.

## s catheters with built-in infection protection.

bringing the infection rate down to 2%, 10 cases would be avoided—and, at the figure of \$6,000 per case for added hospitalization, the added cost for infection would be cut in half, from \$120,000 to \$60,000. At a cost of \$68.20 per ARROWgard™ multi-lumen CVC kit, or \$34,100 for 500 multi-lumen CVCs, the hospital retains over half the savings\*

even after subtracting the catheter cost. Even more important than the economics, potentially, lives may be saved.† Further, you must consider the unnecessary expenditure of time and energy on the part of your staff and the trauma and suffering of the patient.

### Additional patient and physician benefits.

Select Arrow multi-lumen and single-lumen central venous catheters now carry ARROWgard™ protection. And there are other impressive benefits built into select ARROWgard™ CVC kits and sets. These features add up to better patient care with every use:

- The Arrow Blue FlexTip™ is an integral catheter tip which is more pliant than the body. It remains patent and

deflects in case of inadvertent contact with the vessel walls to reduce perforation risk.

- Flexible thromboresistant polyurethane material softens in situ for excellent indwelling characteristics.
- The Arrow® Raulerson Introducer Syringe™

has a hollow design, containing a patented valving system. It allows a spring-wire guide to be placed directly into the vessel lumen so there's less trauma, less contamination risk, and virtually no chance for air embolism.

- The Arrow Advancer™ saves you time by helping you to easily straighten the "J"-tip spring-wire guide and insert it with one hand, advancing it to the proper position with your thumb.
- A centimeter-marked spring-wire

guide (.025" and .035" diameters available) aids in accurate and positive catheter placement.

Not only does Arrow offer more benefits, but you have a wider choice of kits, sets, and accessories for central venous catheterization from Arrow than from any other source.

### Ask for our free infection-control information packet

We have prepared a helpful packet on infection control. It contains many of the articles referenced in this brochure and CVC informational literature. For your free packet, call your Arrow representative, or contact us directly by calling 1 800 233-3187, Ext. 3294, and ask for Joanne.

Refer to package insert for current warnings, precautions, and instructions for use.

\* ARROWgard™ is a joint development of Datas Medical Sciences, Inc., and Arrow International, Inc., using technology developed by Dr. Sherris Mookel and colleagues, in the Department of Surgery, Columbia University, U.S. Patent Numbers 4,819,202; 4,801,405; 4,991,000; 5,019,000 apply. Other U.S. and foreign patents pending.

† U.S. Patent Number RE 34,073; Canadian Patent Number 1,112,826; Foreign patents pending in 10 countries. The Arrow-Heard™ Multi-Lumen Central Venous Catheter is a joint development of Harold H. Arrow, M.D., Ph.D., and Arrow International, Inc.

‡ U.S. Patent Number 4,819,202; Canadian and foreign patents pending. The Arrow-Heard™ Syringe is a joint development of S. David Raulerson, M.D., and Arrow International, Inc.
