Multinational in Form, *Russkii* in Content: Explaining Russian Citizens' Enduring Preference for a Multinational State

Abstract

Russian nation-building policy has often been described as ambiguous, blending a rhetorical commitment to the state's multinational character together with more exclusionary rhetoric and policies. Drawing from original survey questions on national identity commissioned in December 2022, I find that Russian citizens continue to endorse a multinational vision of the Russian state during wartime. Respondents are simultaneously likely to exclude minorities from being fully considered as "true Rossians" [*istinnye rossiiane*], while socioeconomic and political factors are meaningfully associated with these patterns. In line with previous scholarship, these findings underscore the blurriness of the *russkii/rossiiskii* distinction in practice: just as *russkii* should not always be interpreted as an exclusively ethnic term, *rossiiskii* should not be seen as a non-ethnic category, either. The findings in the Russian case carry implications for understanding how nation-builders in multiethnic contexts may seek to cater to ethnic majorities while simultaneously signaling commitments to ethnic diversity.

Keywords: Russia; nation-building; nationalism; ethnicity

1. Introduction[1]

Convening a meeting with members of the Russian Security Council over a week since the full-scale invasion of February 2022, President Vladimir Putin confirmed the first official death in the war – a young officer from Dagestan in the North Caucasus.[2] Weaving the announcement into a narrative of Russian unity, Putin remarked:

> I am a Russian [russkii]…but when I see examples of such heroism as the feat of a young man — Nurmagomed Gadzhimagomedov, a native of Dagestan, a Lak by ethnicity, our other soldiers, I want to say: I am a Lak, I am a Dagestani, I am a Chechen, Ingush, Russian, Tatar, Jew, Mordvin, Ossetian. It is simply impossible to list all the more than 300 national and ethnic groups of Russia. I think you understand me. But I am proud that I am part of this world, part of the mighty, strong and multinational people of Russia. ("Soveshchanie s postoiannymi chlenami Soveta Bezopasnosti" 2022).

The ability for external conflict to catalyze national consolidation through state- and nation-building is well-documented (Tilly 1990; Doner, Ritchie, and Slater 2005; Darden and Mylonas 2016). At the

individual level there is also evidence that national consolidation can dampen exclusionary attitudes towards out-groups when these groups are recategorized as members of a common ingroup (Gaertner et al. 1993). Previous research has found evidence for this in the Russian case; not only did the annexation of Crimea in 2014 boost patriotic sentiment among Russians (Hale 2018; Greene and Robertson 2022), but survey data pre- and post-Crimea found a sharp decrease in hostile attitudes towards minorities from the Caucasus (Levada Center 2014; Alexseev and Hale 2016). Meanwhile, there is also evidence of national consolidation in Ukraine post-2022 in terms of language use and ethnic self-identification (Kulyk 2023, 2024).

Whether the Russia-Ukraine War promotes centrifugal or centripetal forces (or both!) in Russian society is an increasingly important question for scholars and policymakers. While external conflicts can lead to national consolidation, they can also create new divides and exacerbate already-existing cleavages in society. Putin's above announcement belied an uncomfortable pattern that emerged in the subsequent weeks and months: that ethnic minorities from poor regions appeared to feature disproportionately among the Russian military dead (Lenton 2022a; Bessudnov 2022; Kovalev 2022; Vyushkova and Sherkhonov 2023). While protests have generally been infrequent and quickly repressed since February 2022, there have nevertheless been instances of unexpected protest activity in Russian regions, including the Northern Caucasus (Lenton 2022b), the republics and indigenous communities of Siberia (Balzer 2023), and most recently in Bashkortostan (Shkel et al. 2024). There is also some evidence that minorities are less supportive of the war (Marquardt 2023). Putin himself implied that the West aims to stoke ethnic divisions in Russia in his 2024 Address to the Federal Assembly, where he described that the West, "with its colonial practices and penchant for inciting ethnic conflicts around the world," seeks "to replicate in Russia what they have done in numerous other countries" (Putin 2024).

This article contributes to this emerging discussion by exploring Russian national identity and nation-building in the wake of the Russia-Ukraine War. It leverages original survey data from questions fielded by Levada Center in December 2022 to explore citizen attitudes towards the political community. Notably, most Russians (65%) embraced a multiethnic vision of the political community, and this was greater in December 2022 – i.e., nearly a year into the war – than at any point since 1995, when the same question was first posed in surveys. Yet, when later asked about the boundaries of the political community, respondents tended to exclude ethnic minority groups and political opponents. Perhaps most surprising of all was that respondents displayed the most inclusive attitudes towards the only group that unambiguously does *not* consist of Russian citizens: citizens of former Soviet states who consider themselves to be "Soviet people."

While puzzling at face value, this discrepancy is quite consistent with the government's approach to nationalism and nation-building, which embraces a rhetorical commitment to a multinational vision of the Russian state while simultaneously privileging ethnic Russians as the "core" of an imagined *rossiiskii* political community. This vision, I argue, can be thought of as being "multinational in form, *russkii* in content."

These findings make two contributions to scholarship. First, while scholars of Russian nationalism have long acknowledged the conceptual challenges associated with the *russkii/rossiiskii* dichotomy, less research has specifically attempted to quantify the dimensions across which these two terms may overlap for citizens.[3] The findings presented here suggest that this dichotomy may be overstated: just as scholars have cautioned against viewing *russkii* exclusively in ethnic terms, I suggest that *rossiiskii* oughtn't be viewed as an exclusively *non*-ethnic category either. Second, the findings shed light on some of the political drivers of nationalist attitudes and preferences during wartime Russia. Russians continue to prefer a multiethnic vision of the Russian state – a finding that is well-reflected in the rhetorical commitment to multiethnicity at the official level – yet at the same time respondents tend also to display varying levels of exclusionary attitudes towards ethnic minorities and political opponents when prompted to think about the ideal boundaries of the political community. Meanwhile, I also find that those who disapprove of Putin and the government

tend to display more ethnically exclusionary attitudes, while the data also suggest important differences along gender, income, and media consumption lines.

In the following section I review Russian nation-building policy and existing scholarly literature. In Section 3 I introduce the research design. Section 4 presents the results and their interpretation, and Section 5 concludes, outlining implications and further areas for study.

2. Ambiguities in Russian nation-building policy

It is worth briefly noting the challenges associated with the *russkii/rossiiskii* dichotomy. While both words translate as "Russian" in English, the former is both adjective and noun that usually refers to ethnic Russians and Russian culture and language, while the latter is an adjective describing belonging *to* Russia and/or the Russian state. Accordingly, I use the term "Rossian" to refer to Russian in the latter sense (from the Russian *rossianin*). While all citizens of Russia are Rossian, around 1/5 are *not* ethnic Russians.

In the early post-Soviet period under President Boris Yeltsin, the term "Rossian" was encouraged as a civic, supraethnic basis for the political community that could simultaneously avoid the twin threats of ethnonationalism and imperial nationalism while representing a clean break from the Soviet past (Blakkisrud 2023). This was best encapsulated in the 1993 Russian Constitution, which defines the political community as the "multinational people" (mnogonatsional'nyi narod) of the Russian Federation. That said, "Rossian" did not take off as a widely embraced term, and nation-building was largely overshadowed by struggles over political and economic transition that characterized the Yeltsin years (Rutland 2010; Goode 2019).

This tension around the *russkii/rossiiskii* dichotomy illustrates a more fundamental conceptual ambiguity at the heart of Russian nationalism: what are the boundaries of the "Russian" political community? Russia's national identity has long been intensely debated, and particular attention has been paid to the complex relationship between empire and nation (Hosking 1997; Miller 2015; Kolstø 2019). This relationship has continued to shape differing answers to the above question as various forms of imperial and nation-state nationalism have emerged and compete with one another.[4] That these groups' vision of the boundaries of "Russia" can differ quite significantly is, to use Roman Szporluk's term, one of the principal "dilemmas" of Russian nationalism (Szporluk 1989, 17). Furthermore, while competing nationalisms exist in most societies, in the Russian case some of the core questions of the nation remain unsettled in the context of imperial collapse (Tolz 2001, 12). Most instances of the end of empire in the twentieth century led to the shattering of multiethnic polities into smaller aspiring nation-states (Barkey 1997, 104). Russia, however, was unusual among the successor states of the Soviet Union insofar as it emerged post-1991 with an ethno-federal structure (Blakkisrud 2023, 3).

Accordingly, scholars have framed Russian nation-building in terms of being purposefully or by default ambiguous (Rutland 2010; Shevel 2011; Goode 2019; Blakkisrud 2023). Paul Goode has argued that this is an outcome of institutional instability that carried over from the Yeltsin period (Goode 2019). Others, such as Oxana Shevel and Marlène Laruelle, have emphasized the instrumental benefits of such ambiguity for policymakers (Shevel 2011; Laruelle 2017). According to such accounts, the Kremlin is able to maintain situational flexibility vis-à-vis nationalist actors of various stripes and to "avoid tying themselves to an overly rigid concept that would limit their leeway for action" (Laruelle 2017, 96). For Helge Blakkisrud, whilst this flexibility remains, an increasing shift to *russkii* represents an approach to "squaring the civic with the ethnic" which may constitute a more "viable base for its further nation-building project" (Blakkisrud 2023, 12). Thus, ambiguity not only enables tactical shifts where necessary, but may also be sufficiently vague to resonate with a broad spectrum of groups.

A common thread uniting these perspectives is that the ability of the Kremlin to rigidly enforce its nation-building policy has been rather limited. This can be seen when considering the state's lack of capacity – and willingness – to commit to a single nation-building discourse (Shevel 2011), the

prominent role of bottom-up grassroots and parastate actors in discussions thereof (Laruelle 2017; Waller 2021; Grek 2023), as well as the uneven regional context, whereby Russia's ethnic republics have had a variegated degree of autonomy vis-à-vis the federal center (Libman 2023, 171).

Despite this ambiguity, there has been a clear trend towards carving out a privileged position for ethnic Russians as the "core" of an imagined *rossiiskii* political community, a trend which has coincided with the "conservative turn" taken by the Kremlin in Putin's third term (2012-2018), largely interpreted as a response to growing middle-class opposition as exemplified in the large-scale "Bolotnaia" protests of late 2011 (Sharafutdinova 2014; Østbø 2017; Shcherbak 2022). Putin's article on the nationalities question in the run-up to the 2012 presidential election captures this trend quite well – he simultaneously attacked the idea of a "monoethnic [Russian] state," whilst also introducing an element of hierarchy by claiming that "the ethnic Russian people [*russkii narod*] are state-forming [*gosudarstvoobrazuiushchii*]" (Kolstø and Blakkisrud 2016, 39; Putin 2012). This very same turn of phrase would find itself in the 2020 constitutional amendments, notably Article 68, according to which "the state language across the entire territory of the Russian Federation is Russian, *as the language of the state-forming people, entering into a multinational union of equal peoples of the Russian Federation*" [italics indicate text added per the 2020 constitutional referendum] ("Novyi tekst Konstitutsii RF s popravkami 2020," n.d.). Policies such as the curtailment of teaching ethnic minority languages in 2017, and the erosion of ethnic republics' autonomy further testify to this trend (Yusupova 2018; Lenton 2021; Blakkisrud 2023).

At the same time, however, this growing emphasis on *russkii* characteristics is not incompatible with the multiethnic nature of the Russian state. We can see this in the thought of one of the most prominent figures to articulate the importance of a *rossiiskii* nation-building policy, Valerii Tishkov, Director of the Institute of Ethnography and Anthropology of the Russian Academy of Sciences (1989-2015) and Chair of the State Committee of the RSFSR-RF for Nationalities Policy (1992)."[5] While Tishkov describes the *rossiiskii* nation as a "nation of nations"(Tishkov 2008, 4) and is careful to note that the project is not aimed at "making Rossians [*delat' rossiian*] out of ethnic Russians, Tatars, Chuvash, etc." (Tishkov 2008, 10; 2013, 11), he has also suggested that the "cultural basis for the formation of political (civic) nations is most often based on the culture and language of the dominant majority"(Tishkov 2013, 586). For this reason Tishkov considers the French experience of nation-building an appropriate model for a multiethnic federation such as Russia, despite the former being treated as a textbook case of an assimilatory, anti-ethnic nation-building approach by scholars of nationalism (Aktürk 2012).[6]

Nor is the "conservative turn" incompatible with a commitment to multiethnicity. For one thing, the Kremlin's focus on "traditional values" as central to the national community has not only been embraced by the Russian Orthodox Church, but has also preserved a degree of space for non-Orthodox communities to articulate distinct identity narratives (Yusupova 2016; Sibgatullina 2020). This convergence can be seen in the recent articulation of a supranational, "civilizational" understanding of identity, which leaves considerable ambiguity as to the boundaries of the in-group while allowing hybrid identities to exist at the sub-national level (Hale and Laruelle 2021; Blakkisrud 2023; Cerrone 2023).

These ambiguities also extend to foreign policy. On the one hand, Russian foreign policy appeared to take a distinctly ethnonationalist turn in the 2010s. The 2014 annexation of Crimea and subsequent conflict in the Donbas were justified by the Kremlin in terms of the protection of co-ethnics and historical claims to Crimea as "historically Russian" territory (Kolstø and Blakkisrud 2016, 6). Starting in 2018 and leading up to Russia's full-scale invasion of Ukraine in February 2022, Putin's presidential speeches also began to strongly favor the use of "*russkii*" over "*rossiiskii*" when making claims about historical relations with Ukraine and the West (Laruelle, Grek, and Davydov 2023, 16–17). Since then, the Kremlin has intensified its mythologization of Ukraine as part of a perceived "Russian world" [*russkii mir*], with officials regularly framing the invasion in ethnic nationalist language (*The Moscow Times* 2023).

On the other hand, however, many radical ethnonationalists were ultimately disappointed by Moscow's partial and instrumental co-optation of Russian nationalism in the Donbas from 2014 (Kolstø 2016a; Laruelle 2016). Radical ethnonationalists have also been some of the Kremlin's most ardent critics since February 2022, underscoring the extent to which such groups consider the government's embrace of nationalism to be insincere and insufficient (Soldatov and Borogan 2022). Furthermore, the coalescence around conservative values and "civilizational" framings of identity have also allowed ethnic republics such as Chechnya and Tatarstan to partially compensate for their decreased autonomy at home by engaging in paradiplomacy abroad, notably in the Middle East (Galeeva 2022; Klyszcz 2023).

In summary, both domestically and in foreign policy, a rhetorical commitment to the multinational nature of the Russian state has co-existed with attempts to amplify the significance of the ethnic Russian "core."

2.1. Blurred semantic space between russkii and rossiiskii

To what extent is this ambiguity reflected in citizen attitudes? The blurred semantic space between *russkii* and *rossiiskii* presents a challenge for researchers: whilst in some cases *russkii* is used in a clearly ethnic sense, this is often highly contextual, preventing straightforward interpretation. Through the blurring and loosening of its ethnic connotations, *russkii* has been recast as both a state identity as well as functioning as a broader, "civilizational" identity united by values and adherence to the current regime (Goode 2018; Hale and Laruelle 2020; Blackburn 2021; Laruelle, Grek, and Davydov 2023). Even seemingly clear-cut cases of Russian ethnic nationalism such as the slogan "Russia for Russians" [*Rossiia dlia russkikh*] are not always understood in exclusively ethnonationalist terms (Fediunin 2023), rendering it a "crude measure" for ethnonationalism, since it doesn't explain *who* the Russians are that it is referring to (Schenk 2012, 784). Indeed, survey data from 2013 find that when people were asked who the Russians were in "Russia for Russians," only 39% opted for an exclusively ethnic definition (Blakkisrud 2016, 265). Thus, a shift towards the use of *russkii* does not necessarily imply a turn towards ethnic nationalism, but rather that the boundaries of *russkii* remain blurred (Blakkisrud 2023).

Yet, *rossiiskii* also retains a considerable degree of ambiguity, despite being often framed as a civic term juxtaposed to a supposedly ethnic *russkii.* Indeed, as Goode has argued, President Yeltsin – often credited with pursuing a "civic" nation-building policy – did use the term *rossiiskii* to describe the nation but simultaneously presented the term in ways which privileged a perceived Russian ethnic 'core,' describing ethnic Russians "as the cornerstone of Russian statehood and their interests articulated in terms of all-state interests" (Goode 2019, 151).

Existing survey data present a mixed picture of citizen "buy-in" to a *rossiiskii* identity. On the one hand, longitudinal data from the World Values Survey (WVS) suggest that growing numbers of Russians do display pride in their *rossiiskii* identity [*Naskol'ko Vy gordites' tem, chto Vy rossiianin?*], as displayed in Figure 1 (Haerpfer et al. 2022).

Moreover, while it is true that the term "Rossian" failed to resonate at the grassroots level in the 1990s, recent census data do suggest that after over 30 years of post-Soviet development, many citizens find the term to be sufficiently appropriate as a marker for respondents' self-defined ethnicity. Indeed, 206,081 respondents declared their ethnicity to be "Rossian" in Russia's most recent 2021 census – more than a tenfold increase since 2010. This makes "Rossians" the 28th largest ethnic group in Russia, comparable to the number of ethnic Belarusians (Lenton 2023).

On the other hand, though, longitudinal studies carried out by the Russian Academy of Sciences continued to find that when asked the degree to which respondents "feel a sense of community, closeness with the following categories of people," common citizenship is significantly less strong than ethnicity, as shown in Table 1 below (Drobizheva 2020; "Rossiyskaia Identichnost' v Sotsiologicheskom Izmerenii" 2007).
Figure 1. Russian citizens' pride in *rossiiskii* identity [World Values Survey].

Table 1. Feeling of community, closeness with the following categories, % responding "often" [Drobizheva 2020, Russian Academy of Sciences 2007]

	2005	2015	2018
My generation	62	62	59
My profession	55	55	54
All Russian citizens	**20**	**26**	**24**
Residents of my region/republic	25	31	28
Residents of my town/city/village	40	43	39
My co-ethnics	**42**	**48**	**42**
People with the same level of wealth	42	47	41
People with similar political views	23	29	23

3. Research design

To explore the extent to which *russkii* and *rossiiskii* may in practice overlap or be blurred, I included two questions in Levada Center's monthly omnibus public opinion survey in Russia (N=1600), which was carried out in December 2022.[7]

The first question, near the beginning of the survey, was a replication of a question posed across several sociological studies by Russian scholars since 1995, and asks respondents to select the statement they most agree with out of three possible options, which are as follows (respondents are also free to select "don't know/hard to say"):

1. Russia is the shared home of many peoples, each influencing one another. All peoples of Russia should have equal rights, and nobody should have any advantages.
2. Russia is a multinational country, but ethnic Russians, comprising the majority, should have more rights, since they are predominantly responsible for the fate of the country.
3. Russia should be a state for ethnic Russians.

One advantage is that the question helps to neatly and unambiguously identify preferences that the semantic ambiguities discussed above can make challenging. Option 1 has been the default official

position of the Russian government since 1992. Option 2 and 3 are both more clearly ethnic, hierarchical, and run counter to the Russian Constitution, though option 2 is arguably quite close to the government's *de facto* position. Furthermore, fielding a question posed in multiple survey waves since 1995 allows for meaningful across-time trends to be drawn regarding citizen preferences.

The second question, asked towards the end of the survey, analyzes in greater detail the specific boundaries of the *rossiiskii* political community, asking respondents to assess "Which of the following groups, in your opinion, can be considered true Russians [*istinnymi rossiianami*]"? This particular phrasing has been used in previous surveys (Levada Center 2012) to assess respondents' subjective view of the ideal boundaries of the *rossiiskii* political community. Respondents are then presented a randomized list of categories and asked to rank them on a 4-point scale, where 4 represents "definitely can consider," 3 represents "generally possible to consider," 2 represents "generally not possible to consider," and 1 represents "definitely cannot consider." The categories are below:

1. All Eastern Slavs (Belarusians, Ukrainians)
2. People from other countries of the former USSR who consider themselves "Soviet people"
3. People of other traditional Russian religions who are not Orthodox (Islam, Buddhism, Judaism)
4. Atheists
5. Liberals
6. Russians who have left the country[8]
7. Ethnic minorities of Russia whose native language is not Russian

The rationale for selecting these categories was twofold. First, it builds upon previous scholarship's insights on the changing dynamics of Russian identity by including categories which may plausibly exclude one from membership in *russkii* but *not* a broader, *rossiiskii* identity (Goode 2018; Hale and Laruelle 2020; Blackburn 2021; Laruelle, Grek, and Davydov 2023). Indeed, all but (1) and (2) represent categories of people that unequivocally fall under the category of *rossiiskii*, being Russian citizens, making it possible to measure the relative degree to which certain groups are included or excluded from the boundaries of the political community and, by extension, the degree to which a *rossiiskii* identity may overlap with *russkii*. Second, it takes seriously the multidimensionality of national identities (Bochsler et al. 2021). As a closed-ended question allowing respondents to rank several categories of potential "true Russians," it enables comparisons to be made between a broad possible range of components, including ethnic (1,2,3,8), religious (4,5), political (6,7), and linguistic (8).

It is also worth acknowledging some limitations. First, these categories are by no means exhaustive, and while the question offers insights into which components may be more or less *necessary* for consideration as a "true Russian," it is unable to provide insights into the relative salience of these components, nor is it able to indicate whether one, or a combination of components, is alone *sufficient* for consideration as a "true Russian."

There are also considerations when it comes to those categories (1, 2) which seek to capture overlap between non-citizenship and belonging in the Russian political community. Absent the ability to disaggregate these further and with a limited number of categories, I decided upon two expansive renderings that seek to identify respondents' attitudes to variations of "imperial" nationalism identified by previous research (Kolstø 2016a; Laruelle 2018, 7; Kolstø and Blakkisrud 2018, 5). The first category sought to approach this from the perspective of East Slavic ethnicity, which includes both citizens of Russia and of other countries. The second sought to approach this from the perspective of identification with the Soviet Union in a way which was *not* explicitly ethnic, i.e., being neither *rossiiskii* nor necessarily *russkii*. That said, both categories would include ethnic Russians living abroad, and respondents may conceivably have had this community in mind when presented with these categories. As such, caution should be exercised when drawing conclusions

from these categories beyond the degree to which non-citizenship may or may not be seen as compatible with a broader Rossian political community.

A final consideration is that these results represent a single snapshot of attitudes during wartime (Rosenfeld 2022). Pressures to dissemble or misrepresent true beliefs out of considerations of social desirability (Hale 2022) or fear of punishment (Reisinger, Zaloznaya, and Woo 2022) may all be pertinent in the context of Russia in December 2022. I address these considerations in the following section.

4. Results and analysis

4.1. Majority support for a multinational state

Figure 2 below presents longitudinal trends in Russian citizens' attitudes towards the multinational character of the Russian state, compiling previous iterations of this question as reported from different sources (from 1995 through 2017), together with the response from the Levada omnibus in December 2022 ("Rossiiskaia Identichnost' v Sotsiologicheskom Izmerenii" 2007, 96; Gorshkov, Krumm, and Petukhov 2011, 207; Drobizheva 2018, 110). A couple of trends are noteworthy. First, Russian citizens have consistently displayed preferences for a multinational state, while only between 10-20% have opted for the ethnocentric, exclusionary "Russia for [ethnic] Russians." This is not to say, however, that respondents eschew ethnocentric attitudes altogether. In fact, a sizeable – and growing – minority of respondents had opted for the second option throughout the 2000s and 2010s, embracing Russia's multinational character while nevertheless positing that ethnic Russians constitute a privileged "core." Second, the results from the December 2022 omnibus show that Russians continue to prefer a multinational state, with the level of support in 2022 at its highest point since 1995. While the magnitude of this increase is likely in part to a reduction in "don't know/ hard to say" responses in 2022 compared to 2017, the increase cannot fully be attributed to this. Similar results hold across the political divide, too, as shown in Figure 3. Those who disapprove of Putin tend to be less supportive of a multinational state – a trend which is discussed in more detail below – but even in this case a majority still expresses support for a multinational state. Moreover, two-sided t-tests compared the differences in means among those who expressed support for Putin versus those who did not: for all options except the second ("Russia is a multinational country…")

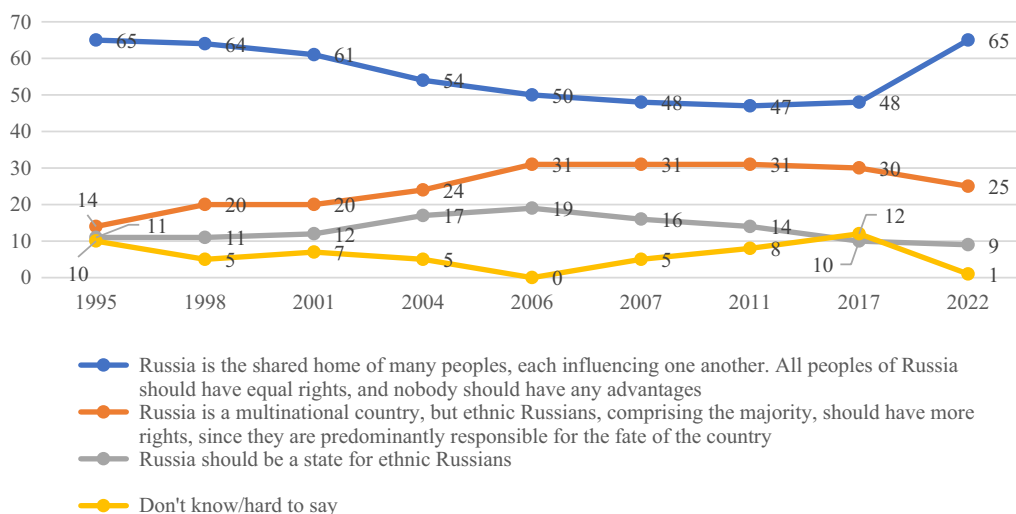

Figure 2. Attitude of Russian citizens to the multinational character of the Russian state, % (one response allowed).
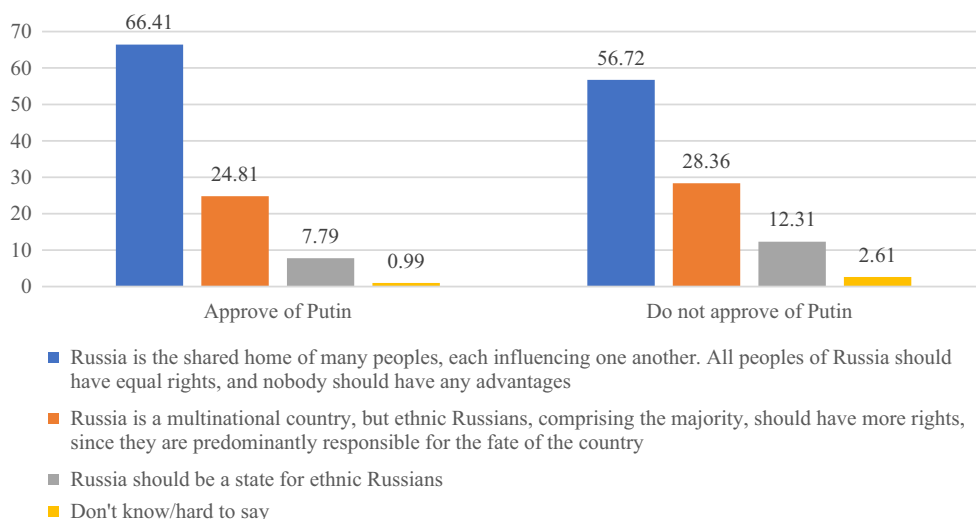

Figure 3. Attitude of Russian citizens to the multinational character of the Russian state by support for Putin, % (one response allowed).

the means were statistically significant at the conventional $p < 0.05$ level, meaning that we can be confident that these differences are not due to chance alone.

4.2. "True" Rossians culturally Russian (russkii) and politically loyal

When later asked who counts as "true Rossians," however, a more complex picture emerges. Figure 4 below shows the average score across the 8 categories asked, where 1 represents "definitely cannot be considered" and 4 represents that the group "definitely can be considered" true Rossians.[9]

One thing to point out from the onset is that *all* these groups' average score is lower than 4, meaning that all of the above categories are perceived to depart from fully belonging in the *rossiiskii* political community by respondents. At the same time, though, many of the results are around 3.0 out of 4, indicating that on average people considered that it was "generally possible to consider"

Figure 4. Which of the following groups, in your opinion, can be considered true Rossians [*istinnymi rossiianami*]? Average values, excluding "don't know/hard to say".
Figure 5. Which of the following groups, in your opinion, can be considered true Rossians [*istinnymi rossiianami*]? Percentage of respondents.

these groups as "true Rossians." Nevertheless, these findings also indicate that departure from *russkii* characteristics – being of Caucasian ethnicity, non-Orthodox faith, or being a speaker of another language – tends to exclude one from full consideration as a "true Rossian", even though all these groups are Russian citizens. Of these, language appears to be slightly more important, as indicated by the fact that the lowest score among these is for ethnic minorities whose native language is *not* Russian.

The starkest findings, however, were related to political attitudes. Both liberals and exiles were the lowest-ranked groups by some margin. These findings are consistent with a similar survey conducted by Levada Center in 2012 which found both *russkii* characteristics and respect of Russia's political system to qualify one for membership as a "true Rossian" (Levada Center 2012). While leaving Russia appears to heavily disqualify one from being considered a "true Rossian" in the eyes of respondents, almost 25% of respondents selected "don't know/hard to say" when it came to liberals (compared to just 7% for exiles), as indicated in the rightmost bars in Figure 5. The high non-response rate for liberals may reflect the fact that it remains a more ambiguous *political* category in its relationship to the national community. Interestingly, respondents' greatest consensus formed around the only group which does *not* consist of Russian citizens – people from former Soviet countries who consider themselves to be "Soviet people." This was also the category in which there were fewest "hard to say" responses *and* the standard deviation was the lowest. Put simply, responses were consistently inclusive towards this group.

4.3. Variation by socioeconomic and political factors

One way to further analyze the data is to see which types of respondents are more likely to be inclusive or exclusive towards the categories presented. To do this, I ran multiple regression models, drawing from socioeconomic and political questions posed by Levada Center earlier in the survey. Results are displayed in Table 2. The dependent variable across the models is the degree to which a specific group can be considered "true Rossians" according to respondents. The independent variables examine the specific effect of a marginal increase in that factor when holding all other

Table 2. Effect of socioeconomic and political variables on whether a respondent considers a given group to be considered "true Rossians"

* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$. OLS, no weights or clustering of standard errors. *N* refers to the number of observations. "Don't know" responses were dropped, accounting for differences in the number of observations. Variables are coded 0 or 1, except for "income" (measured 1-4 where 4 represents the highest quartile of income and 1 the lowest), "education" (measured 1-3 where 1 represents middle school or below, 2 represents high school education, and 3 represents higher education), and "age group" (measured 1-4 where 1 represents 18-30, 2 represents 31-39, 3 represents 40-55, and 4 represents 55+).

factors constant. The values display the average predicted effect of a 1-unit increase in the given variable on the degree to which the corresponding category of people can be considered "true Rossians," holding constant all other variables. Those values marked in bold meet the conventional threshold for statistical significance ($p < 0.05$) meaning that we can be confident that these patterns are not the result of chance alone.

Several noteworthy patterns emerge from the data. First, disapproval of the government predicts *less* inclusivity towards ethnic minorities. This is the case for those respondents who consider that the "Country is headed in the wrong direction," as well as those who do not approve of Putin's performance as president. Ethnic Russians are also much less likely to consider Caucasians, non-Orthodox Russian citizens, and speakers of other languages as "true Rossians." These findings are consistent with previous research which has found that opposition to Putin and Russian ethnicity tend to be associated with greater xenophobia towards ethnic minorities (Gerber 2014; Herrera and Kraus 2016; Chapman et al. 2018). The size of these effects is also substantively significant; holding all other variables constant, believing that the country is headed in the wrong direction predicts over a 12% decrease in inclusiveness towards considering non-Orthodox Russian citizens as "true Rossians."

Second, socioeconomic factors such as wealth and education predict marginally more inclusive attitudes, most commonly towards political opponents and nonreligious Russians. Media consumption – in this case, whether a respondent uses the internet daily – is associated with more positive attitudes towards atheists, liberals, and exiles, while greater education predicts more inclusion towards all categories.

Finally, there is a noticeable gender divide in the results: female respondents in the survey were more inclusive of liberals but *less* inclusive of other identity groups. These relationships are mostly

statistically significant across the models, and contrast with findings from previous survey-based research on Russian nationalism, which has found the opposite (Gerber 2014; Herrera and Kraus 2016). One explanation may be related to the specific international context in December 2022. In analyzing longitudinal data from the European Social Survey, Andrey Shcherbak notes that Russian women consistently held more conservative attitudes than men, *except* for in 2014, which he concludes is due to the "rally-round-the-flag" effect being "probably mostly a male story" (Shcherbak 2022, 213). Indeed, experimental evidence from 2015 found that reminding people about the Crimea annexation created a significant bump in support for Putin among male respondents but not among women (Hale 2018, 375). If a "rally-round-the-flag" effect were taking place in Russia in December 2022 and embraced by men in similar ways to that of 2014, this might explain why women are more inclusive than men of opposition-leaning groups such as liberals and exiles.

Available evidence certainly points to a gendered difference in attitudes towards the war. For one thing, the war has been presented inside Russia in a highly masculinized form (Wood 2024, 2), which may help to account for why women appear less supportive of the war than men. Military bloggers – a predominantly male group – have become key opinion leaders in the wake of the full-scale invasion, with hundreds of thousands and even millions of followers (Laruelle 2024, 24). In contrast, emerging research has found women to be more active on anti-government YouTube channels (Savchenko and Freedman 2024). These differences also appear in public opinion data: as recently as September 2024, Levada Center data show that 62% of women endorsed beginning peace talks (compared to 45% of men) while 55% of women (compared to 38% of men) considered the so-called "Special Military Operation" to be more harmful than beneficial (Levada Center 2024).

This, however, does not in itself account for the gendered difference in attitudes towards religious and ethnic minorities. While the survey data here are limited in their ability to fully explain these findings, they do reveal important gendered differences that future research designs may be able to test. One such possibility is that it is a side effect of the sort of rallying identified above, whereby an overall bump in support for the war among Russian men has also led to greater inclusiveness towards ethnic and religious minorities. Given that the contributions of ethnic and religious minorities in the Russian military are prominent in the narratives of the Kremlin and military bloggers, this appears a plausible explanation.

An alternative explanation may be that there are greater rates of survey misreporting among male respondents due to the greater fear of repression (and direct risk of being mobilized). That said, I do not think that the post-2022 repressive environment is systematically biasing these results, for instance through systematically misreporting true attitudes. For one thing, respondents were free to select "don't know/hard to say" for the questions posed and any of the categories in the second question: almost a quarter did exactly this for the category of "liberals," per Figure 5. Moreover, if respondents were deliberately misreporting based on what they perceived the Kremlin wanted them to select, then the findings here strongly suggest that it is in the direction of indicating support for Putin and displaying more inclusive attitudes towards ethnic minorities. In other words, if we believe such misreporting is occurring, then the explanation is that it is *because people believe the Kremlin supports a multinational state* and therefore respondents express more inclusive attitudes.

Crucially, if this were the case, it would also mean that the *rossiiskii* category analyzed here is more ethnically exclusive in the eyes of respondents than the values presented in Figure 4. Of course, another explanation may be that misreporting may be taking place for some questions but not others. For instance, respondents could be misreporting their true opposition to Putin but not misreporting responses related to the nation. Yet even in this case, this would not invalidate the overall findings on attitudes towards the nation, though it might account for some of the differences across political and socioeconomic groups' responses. Future research might explore the gendered effects of the war on nationalist attitudes, or examine citizens' understandings of what Putin's stance on the nation is, in order to further evaluate these findings.

5. Conclusion

This article explores developments in Russian nationalism and nation-building. Its findings make two contributions to scholarship. First, they provide quantitative evidence that a *rossiiskii* identity is multifaceted, and should not be seen as an exclusively "civic" or non-ethnic identity category juxtaposed to an "ethnic" *russkii* one. Use of *russkii* or *rossiiskii* alone is likely insufficient to infer the degree to ethnic inclusivity of populations without further contextualization, which has implications for researchers working on issues of identity in the Russian context, particularly those who use surveys or other quantitative data. Further investigation might explore which categories are seen to be as sufficient for consideration as *russkii/rossiiskii*, as well as the relative salience of different categories.

Second, the evidence points to some of the political drivers of nationalist attitudes and preferences during wartime Russia. Support for a multinational state reached its highest level in 2022. That said, this support coexists with a tendency to exclude groups who depart from *russkii* characteristics from fully being considered "true Rossians". This tension of embracing a multinational vision of the state while simultaneously privileging ethnic Russians as the "core" of an imagined *rossiiskii* political community is not simply a top-down phenomenon, but also appears consistent with how citizens themselves understand the boundaries of the political community. Rather than be understood as a bug, this should be seen as a feature of Russia's nation-building approach; indeed, nation-builders in multiethnic countries may have incentives to both cater to ethnic majorities while simultaneously signaling commitments to ethnic diversity.

This approach – one that is "multinational in form, *russkii* in content" – did not emerge in February 2022 but has maintained its relevance for contemporary Russian nation-building. Starker, however, were the exclusionary attitudes towards political, rather than ethnic categories of Russian citizens such as liberals and exiles. At the same time, disapproval of Putin predicts more ethnically exclusionary attitudes. Perhaps most surprising of all was that the group of individuals most likely to be considered "true Rossians" was the only group that unambiguously does *not* consist of Russian citizens: citizens of former Soviet states who consider themselves to be "Soviet people." This finding suggests that the boundaries of the nation as perceived by Russian citizens may be situationally flexible, both regarding the role of ethnicity as well as citizenship therein.

Notes

1 This study was approved by George Washington University's Institutional Review Board (IRB) in December 2022 (IRB# NCR213843).
2 News of Gadzhimagomedov's death, however, had already circulated in the media: several days earlier, the governor of Dagestan announced his death on Instagram, while other regional governors and local administrators had also begun to disclose information on casualties, and some public funerals had also taken place, such as in Tatarstan.
3 One exception is a recent article by Laruelle, Grek, and Davydov, which traces shifts in official use of the terms *russkii* and *rossiiskii* in official discourse. See Laruelle, Grek, and Davydov (2022)
4 Indeed, Marlene Laruelle (2018, 7) identifies four broad sets of nationalism in Russia: imperial, Eastern Slavic, ethnic Russian, and Rossiiskii, of which only the latter is unambiguously limited to

the contemporary borders of the Russian Federation. See also Tolz 2001 and Kolstø and Blakkisrud 2018 for similar attempts to categorize Russian national identity and nationalisms.

5 Indeed, Pal Kolstø claims that "the theoretical underpinnings of the Russian Federation-centered nation-building project are practically the work of one man, Valerii Tishkov" (Kolstø 2016b, 32).

6 In one example he cites a dispute between the leader of the French Communist Party, Georges Marches, and the Soviet Academy of Sciences, where ethnographer Solomon Bruk published an ethno-demographic reference book in 1981 cataloguing groups across the world. Tishkov recounts that Marches tried to explain to Brezhnev during a meeting that contrary to the handbook, which listed Corsicans, Catalans, Bretons, etc., there were no ethnic groups in France, but only the French nation. Revealingly, Tishkov claims that whilst at the time he sided with Bruk, now he believes Marches to be right, since "otherwise, according to Bruk, it turned out that Corsican Bonaparte was not French, and former President Sarkozy even less so…the French nation is a historical, cultural, and social-political community within the state, possessing a cultural complexity *that shrank during the years of political centralization and general civil upheavals* [emphasis mine]" (Tishkov 2013, 597).

7 The ability to field these questions several months into the war was largely fortuitous, owing to having prepaid prior to the full-scale invasion and then awaiting IRB approval before the questions could be fielded.

8 "*Uiekhavshikh iz strany rossiian*" – in the context of the ongoing war, this is a clear reference to those who left *after* February 2022, though it's possible that some respondents interpreted this in a broader sense of those who live abroad, although the term "compatriots" [*sootechestvenniki*] would be more appropriate in this case.

9 "Don't know/hard to say" responses were not included in calculating the average scores.
